Temitting/nonrelapsing experimental allergic encephalomyelitis.";
Jimmunol. 163:256-2266(1999).
TEUNCTION: CHEMORACIE RACIOR THAT ATTRACTS EOSINOPHILS, MONOCYTES,
AND LYMPHOCYTES BUT NOT NEUTROPHILS. POTENT MONOCYTE ACTIVE
CHEMOKINE THAT SIGNALS THROUGH CCR2. INVOLVED IN ALLERGIC
INFLAMMATION AND THE HOST RESPONSE TO PATHOGENS AND MAY PLAY A
PIVOTAL ROLE DURING EARLY STRAGES OF ALLERGIC LUNG INFLAMMATION.
C-1- SUBBURTH: HOMODIMER (BY SIMILARITY).
TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE LYMPH NODES AND
THYMUS. ALSO FOUND IN THE SALIVARY GLANDS CONTAINING LYMPH NODES,
BREAST, HERRT, LUNG, BRAIN, SMALL INTESTINE, KIDNEY AND COLON.
C-1- INDUCTION: BY INTERFERON GAMMA AND LIPOPOLYSACCHARIDE (LPS).
C-1- SUBLINARTY: BELLONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. LYMPHOCYTES, NEUTROPHILS, AND EOSINOPHIL LEUKOCYTES. ENHANCES THE
PROLIFERATION OF CD34 MYELOID PROGENITOR CELLS.

-!- SUBCELLULAR LOCATION: Secreted.

-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; HCC-1 (SHOWN HERE) AND HCC-3;

-!- TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY IN SEVERAL NORMAL

TISSUES SPECIFICITY: EXPRESSED CONSTITUTIVELY IN SEVERAL NORMAL

TISSUES SPLEEN, LIVER, SKELETAL AND HEART MUSCLE, GUT, AND BONE

MARROW, PRESENT AT HIGH CONCENTRATIONS (1-80 NM) IN PLASMA.

-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE

C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-OCT-1996 (Rel. 34, Created)

A new macrophage derived chemokine, MDC, a member of the C-C (Cys-Cys) subfamily of cytckines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and angiogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences can be derived from MDC encoding sequences.
 treatment of inflammatory diseases, MDC antibodies used to treat
Crohn's disease, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amino acid sequence of human STCP-1.

                                                                                                                                                                             been isolated from a 90 per cent CDIa+ cDNA library and obtained by random sequencing. Nucleic acid sequences encoding the chemokines can be used for detection, in e.g. forensic techniques. Antibodies and other binding agents may be used in diagnostics. The chemokines themselves are useful for treatment of, e.g. cancer or degenerative conditions. Abnormal proliferation, regeneration, degeneration or atrophy may be treated by

       macrophages or other immune system cells. They can be included (optionally chemically modified) with a pharmacoutically acceptable carrier and optionally other pharmacouticals (e.g. AZT, antibiotics etc.) in therapeutic compositions for treating these conditions. STCP-1 also useful to assay for inhibitory compounds used to reduce circulatory system STCP-1 levels to alleviate e.g. joint inflammation associated with rheumatoid arthritis, lupus or other autoimmune diseases. The nucleic acids are useful to prepare antibodies or hybridomas. The stronger of the stronger of the system STCP-1 DNA/RNA in mammalian samples.

This protein is used to produce the antibodies of the invention. The antibodies are useful for purifying MDC polypeptides, for detecting endogenous MDC in a host, and for modulating binding of MDC to its receptors. The DNA encoding this sequence can be used for identifying and isolating non-human MDC monologues. The MDC protein is potentially useful for treating inflammatory disorders, cancer, etc. Antagonists of MDC can be used for treating Crohn's disease, arthritis, atherosclerosis etc.
                                                                                                                                                                                                                                         1 LVLLAVALQATEAGPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR 60

This belongs to the CC class of chemokines. The efficacy of a vaccine is enhanced by combining it with one or more chemokines to enhance the immune response to an antigen. This can be humoral or cell-mediated immune response purified chemokines, fragments, derivatives or analogues are
                                                       administered either concurrently with one or more purified antigens against which an immune response is desired or within a time period either before or after antigen administration. The chemokine gene is isolated by PCR, and administered by constructing an expression plasmid vector which can be expressed in a coordinated manner upon introduction in a suitable cell. The vaccines are immunostimulatory and can be used to treat microbial diseases especially HIV.

                                                                                                                                                                                                                                                                                                                                                                                                                           Macrophage derived chemokine; MDC; chemotaxis; chemotactic cytokine; inflammation; immune response; inflammatory disorder; Crohn's disease; atherosclerosis; arthritis; pulmonary fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes macrophage derived chemokine (MDC) analogues which are capable of inhibiting MDC induced chemotaxis. Therefore, the MDC analogues may be used to modulate inflammatory and immune responses allowing for the treatment of disorders associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 LVLLAVALQATEAGPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR

The invention provides vertebrate MDC polypeptides (see also AavOS876, AavOS877 and AavOS80) and isolated polyputclectides encoding them, vectors and host cells, and methods for the recombinant or synthetic production of MDC. Also provided are MDC analogues, antibodies and antagonists. The MDC antagonists are used for the preparation of medicaments for the suppression of the proliferation of amammalian immunodeficiency virus, for inhibiting platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting MDC-induced activation, companies or proliferation of clups and for treatment or a mammal, and in treating asthma (all claimed). MDC polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vertebrate Macrophage Derived Chemokines, analogues and antagonists

The products can be used for treating or preventing LV infection or replication, particularly HIV infection or replication. The products can also be used for the prognosis for a LV infection, particularly an HIV infection or infection or methods can also be used with other LVs, e.g. sindan immunodeficiency virus, feline immunodeficiency virus and bovine immunodeficiency virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 LVLLAVALQATEAGPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR 60

The method comprises administering a CCR4 modulating agent. It has been found that systemic administering a CCR4 modulating agent. It has been found that systemic T cells such as express high levels of CCR4. Ligands of CCR4 such as TARC (thymus and activation-requiated chemokine) and MDC (monokine derived chemokine) act as an adhesion trigger and, upon CCR4 binding, these cells undergo integrin dependent arrest to the appropriate vascular receptors. This arrest acts to localize the cells at the trarget site. The method modulates this triggering and CCR4 mediated chemotaxis to affect the localization of T cells in targeted tissues. The active agent may be a CCR4 agonist that acts to enhance T cell localization. Alternatively, it may be an antagonist that blocks CCR4 inclodical activity. A CCR4 andonist may be administered for the treatment of inflammation. The present sequence represents a human MDC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating the trafficking of systemic memory T cells in mammals by administering a CCR4 modulating agent, useful for the treatment of

The present sequence represents a novel human macrophage-derived C-C chemokine (MCC) of the invention. Chemokines comprise a family of small secreted proteins which attract and activate leukocytes, thereby aiding in the stimulation and regulation of the immune system. C-C cytokines are a subfamily known to activate monocytes, causing calcium flux and cemotaxis. The invention comprises a novel human MDC protein and nucleic acids, as well as methods for the production of the MDC protein and nucleic of the invention is useful in medical imaging (e.g. for imaging sites of infection, inflammation, and other sites having C-C chemokine receptor molecules. Inhibition of MDC is believed to be useful in treating diseases involving macrophages (e.g. Crohn's disease, rheumatoid arthritis or atherosclerosis). Alternatively, augmenting the effects of MDC is believed to be beneficial towards wound healing and anglogenesis. Also MDC or MDC agonists may be beneficial to patients receiving chemotherapy or radiation therapy and in the treatment of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 LVLLAVALQATEAGPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR 60

C-C (Cys-Cys) branch of intercrine chemokines. Ck-beta-13 is useful for treating patients lacking chemokine beta-13 by gene therapy. Ck-beta-13 stimulates the invasion and activation of host defence cells making it useful for treating solid tumours, e.g. Kaposi's 'sarcoma, and for enhancing resistance to acute and chronic infections, e.g. mycobacterial infections. The chemokine induces chemoteric migration of monocytes, neutrophils, eosinophils, T lymphocytes, basophils and fibroblasts to sites where they are needed. Eosinophils may be attracted to the site of a parasitic infection to kill parasite larvae. Ck-beta-13 also recruits debris-clearing and connective tissue promoting inflammatory cells, and is therefore used to stimulate wound healing, prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mediated autoimmune diseases, psoriasis, to regulate haematopoiesis and to inhibit angiogenesis. Ck-beta-13 antagonists inhibit activity of the chemokine which is useful for treating certain autoimmune diseases, atherosclerosis, chronic inflammatory and infective diseases, allergic reactions, rheumatoid arthritis, silicosis and bone marrow failure.
                                                                                                                                                                                                                                                                                  Chemokine beta 13; Ck-beta-13; C-C; Cys-Cys subfamily; immune cell; defence; activation; eosinophil; monocyte; macrophage; T lymphocyte; T cell; basophil; gene therapy; tumour; cancer; neoplasia; infection; Kaposi's sarcoma; cirrhosis; osteoarthritis; pulmonary fibrosis; leukaemia; autoimmune disease; psoriasis; inflammation; allergy; rheumatoid arthritis; silicosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW07604 shows human chemokine beta-13 (Ck-beta-13), a member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 scarring and treat liver cirrhosis, osteoarthritis and pulmonary fibrosis. Ck-beta-13 may also be used for treating leukaemia, T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "given as encoded by CAC codon in AAT44026"

invention. The polypeptide and nucleic acid are useful in diagnosis and treatment of immune system-related disorders in mammals (preferably humans). Such disorders include tumours, cancers, interstitial lung disease and disorders include tumocal, cancers, interstitial lung disease and disorders include tumocal, including leukaemias, lymphomas, autoimmune disease etc. For example, certain tissues in ammunes with cancer of the immune system express enhanced/decreased levels of CKbeta-13 and mRNA encoding CKbeta-13, and diagnosis can be achieved by assaying CKbeta-13 gene expression and comparing to standard levels. The polypeptides can be administered therapeutically in pharmaceutical compositions e.g. to treat immune system-related disorders as above, treat sepsis, inhibit bone marrow stem cell colony formation curing cancer therapy, regulate haematopoiesis, stimulate wound healing etc. Compositions comprising the polymocleotides may also be administered, especially to express CKbeta-13 polypeptide in hosts to treat dysfunctions associated with aberrant endogenous CKbeta-13:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      activity. The polynucleotides are also useful for mapping of chromosomes/chromosome sites. The polypeptides are useful to screen for agonists and antagonists of CKbeta-13 activity. The antibodies are useful diagnostically or therapeutically e.g. as antagonists to treat subjects requiring CKbeta-13 reduction.

CKbeta-13 polypeptides and polynucleotides are useful for treating deficiencies or disorders of immune systems, haematopoletic cells, autoimmune disorders such as Addison's disease, haemolytic anaemia, rheumatic arthritis, dermatitis, allergic encephalomyelitis, glomerulonephritis, Goodpasture's Syndrome, Grave's Disease and multiple sclerosis, allergic reactions such as asthma, anaphylaxis, hypersensitivity, blood group incompatibility, organ rejection, graft vs host disease, inflammatory disorders including septic shock, sepsis or systemic inflammatory response syndrome, infectious diseases, immune system relative disorders including leukemia, wound healing, acute and chronic infection and inflammatory bowel disease, cancers, psoriasis,

The analogue has an amino acid substitution at residue 2 of the mature polypeptide. MDC analogues (see also AAV05872-75) are expected to be antagonists of MDC, inhibiting activity by competitively binding to

the receptor that recognises MDC or forming inactive heterodimers with MDC. MDC antagonists are used in claimed methods for the proparation of medicaments for the suppression of the proliferation of a mammalian immunodeficiency virus, for inhibiting platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting MDC-induced activation, chemotaxis or proliferation of cells that express CCR4, for inhibiting or palliating an allergic reaction in a mammal, and for treating asthma.
                                                                                                                                                                                                                    Length 93;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
